

Abstract

Disclosed is a driving device, and more particularly, to
a lens driving device for transporting a lens of an optical
5 instrument via separate actuation of the lens itself. In the
driving device, guide means are connected perpendicularly with
the lens for guiding reciprocating movement of the lens.
Driving means is arranged coplanar with the lens and fixed by
a first end to a periphery of the lens for providing the lens
10 with a transport force which is larger than an interactive force
between the lens and the guide means.
